

NutriLens

Scan, explore, decide — every product, the right choice for you.

THE PROBLEM

It's not an education issue, it's a design problem. Labels are packed with technical jargon, printed in tiny font, and built for compliance, not communication.

For those with **allergies**, **intolerances**, or **specific dietary** needs, every wrong purchase is a potential health hazard.

THE SOLUTION

NutriLens - an iOS app that transforms your smartphone into an intelligent nutrition assistant

By framing a product through the camera, the user receives instant **multisensory feedback** (color-coded, auditory, and haptic) about its compatibility with their dietary profile.

By long-pressing anywhere on the screen, an Augmented Reality **info card** appears and, with a single tap, rotates to reveal all relevant details.

At the center of the entire system lies the user profile: 14 EU-mandated allergens plus 9 configurable dietary requirements.

THE POSSIBLE SCENARIOS

DANGER STATE

Highlights any forbidden allergens or dietary profiles for which the product is **unsuitable**.

- EU-declared allergens present in the product and/or unmet dietary requirements
- intense haptic feedback paired with an alert soundfeedback

WARNING STATE

Signals the presence of **potentially risky** allergen traces within the product.

- declared traces of EU-regulated allergens present in the product
- moderate alert to support an informed choice

COMPATIBLE STATE

Confirms that the product is fully compatible and reveals its complete nutritional profile.

- no relevant allergens or traces detected, and all dietary requirements are fully met
- confirmation alert with detailed corresponding nutritional values

HOW DOES IT WORK

The entire pipeline runs on-device, with no calls to external servers: zero latency, zero dependence on connectivity.

FOOD COMPARISON

NutriLens - extends beyond individual products, enabling a direct comparison between two food items

The app generates **two side-by-side AR cards**. If either product contains allergens, traces, or does not meet the user's dietary requirements, it is immediately 'rejected' visually, guiding the user toward the safe alternative.

If both products satisfy the user's constraints, the app activates a Nutri-Score-based comparison algorithm. An **intuitive graphical indicator** highlights the item with the superior nutritional profile.

PROFILE

NutriLens - it also includes a dedicated user section, offering two distinct yet complementary functions

PROFILE

The profile is set once but can be modified at any time; it is designed for users who later discover a new intolerance or simply change their diet.

CHRONOLOGY

Every scanned product is saved automatically and treated like a collectible card, viewable inside a 3D Augmented Reality album.

Thank you for **your
attention**
